

1. Introduction

Event management involves coordinating many moving parts such as venues, speakers, attendees, sponsors and budgets. When these parts are handled separately, organizers spend more time chasing information than delivering a good event. This document introduces EventForce, a Salesforce-based solution designed to bring all of these activities under one roof.

1.1 Project Overview

EventForce is a Customer Relationship Management (CRM) application built on the Salesforce platform. It allows organizers to create events, assign venues, register attendees, record sponsors and track expenses from a single Lightning application. Because it runs on the cloud, the system can be accessed from anywhere and always shows up-to-date information to every authorized user.

EventForce is a Salesforce-based event management platform that helps organizers plan, manage and track events such as conferences, workshops, technical fests and seminars. It brings venues, attendees, speakers, sponsors, registrations and budgets into a single CRM application with automation, reports and dashboards.

1.2 Purpose

The main purpose of EventForce is to replace manual and spreadsheet-based event handling with an automated, centralized and secure system. Manual methods are slow, error-prone and difficult to share among team members. By using Salesforce, the project demonstrates how declarative tools such as objects, flows and dashboards can solve a real business problem without heavy coding.

Traditional event handling relies on spreadsheets, emails and phone calls. This causes data loss, duplicate registrations and poor visibility. EventForce replaces this with a centralized, automated and secure system built on Salesforce.

1.3 Problem Statement

Event organizers currently depend on spreadsheets, emails and phone calls to manage their work. This leads to scattered data, duplicate registrations, delayed confirmations and a lack of visibility into budgets and sponsorships. The table below summarizes the key problems and their effects on the organization.

#	Problem	Impact
1	Data scattered across spreadsheets	Hard to find and update information
2	Duplicate or missed registrations	Wrong attendee counts
3	Manual email confirmations	Time-consuming, inconsistent
4	No budget vs. actual tracking	Overspending goes unnoticed
5	No sponsor contribution tracking	Revenue not measured
6	No real-time reports	Slow decision making

1.4 Objectives

The objectives describe what the project aims to achieve and how success will be measured. They focus on centralizing data, automating routine communication, preventing venue overbooking and giving managers real-time insights. Each objective is linked to a measurable outcome so that the final solution can be evaluated clearly.

#	Objective	Success Measure
1	Centralize event data	All data in one Salesforce app
2	Automate registration emails	Email sent within seconds
3	Prevent venue overbooking	Validation rule blocks over-capacity
4	Track budget and sponsors	Roll-up summary fields available
5	Provide live dashboards	Dashboard shows attendance and revenue

1.5 Scope

Defining scope keeps the project focused and realistic within the available time. The in-scope items cover everything that will be configured inside Salesforce, while the out-of-scope items are features that may be added in the future. This separation avoids confusion and prevents unnecessary work during development.

In Scope	Out of Scope
Custom objects, fields, relationships	External payment gateway
Validation rules and Flows	Native mobile app development
Email alerts and reminders	Third-party ticketing integration
Profiles, roles, permission sets	AI-based recommendations
Reports and dashboards	Multi-currency support

1.6 Stakeholders

Stakeholders are the people who use, benefit from or are affected by the system. Identifying them early helps in collecting the right requirements and designing suitable access levels. In EventForce, the organizer is the primary user, while attendees, sponsors, managers and administrators play supporting roles.

Stakeholder	Role	Interest
Event Organizer	Primary user	Create and manage events
Attendee	End user	Register and receive updates
Sponsor	External partner	Track contribution and visibility
Event Manager	Decision maker	Monitor reports and budget
Salesforce Admin	Technical owner	Configure and maintain the app

1.7 Technology Stack

The technology stack lists the tools and platforms used to build the solution. Salesforce is chosen because it offers ready-made data storage, security, automation and reporting features. Flow Builder is used for automation, Lightning App Builder for the user interface and GitHub for version control and submission.

Layer	Tool
Platform	Salesforce Developer Org
UI	Lightning App Builder, Lightning Experience
Automation	Flow Builder, Email Alerts
Logic (optional)	Apex Triggers
Analytics	Reports and Dashboards
Version Control	GitHub

1.8 Expected Benefits

Implementing EventForce brings several benefits to the organization. Automation saves time, validation rules improve data accuracy, dashboards provide instant insights and the cloud platform allows the system to scale as the number of events grows. Together these benefits improve both organizer productivity and attendee experience.

Benefit	Description
Time saving	Automation removes manual follow-ups
Accuracy	Validation rules keep data clean
Visibility	Dashboards give instant insights
Scalability	Easy to add new events and users
